

What to Expect After PicoSure Laser Procedure

Here are some important things to expect with the picosure laser procedure:

- It is important that you do not evaluate your face (spots, wrinkles or scars) until you have had the complete recommended sessions of the procedure done or as determined by your practitioner.
- Warmth or heat sensation is expected and will last approximately for one hour
- Mild bruising, redness and swelling as well as tingling sensations similar to sunburn are normal and will resolve shortly thereafter.
- There may be slight darkening (bronzing) of the skin that is noticeable 3-10 days post treatment which will resolve without intervention.
- Avoid sun exposure between treatments. Apply SPF 30+ to protect exposed treated areas if you are sun exposed.
- Optimal results are achieved overtime and require maintenance treatments
