

ASK YOUR OB/GYN:

Which Procedure Is Right for You – SculpSure or SmartLipo?

SCULPSURE

SMARTLIPO

If you have trouble spots of fat that seem resistant to diet and exercise, then SculpSure body contouring is for you.

If you have accumulated fat deposits in troublesome areas, then SmartLipo is a great solution for you.

SculpSure is a non-invasive, FDA Approved, laser procedure that targets and heats the fat cells permanently, removing them from your body.

This safe laser procedure melts fat and tightens skin for a more contoured appearance. It is done in-office under local anesthesia.

A series of treatments is typically recommended for optimum results, with each treatment area lasting 25 minutes.

Generally, this is a one-time procedure that lasts from two-to-four hours depending on the area.

There is no downtime, you will be able to resume your daily activities immediately.

After this procedure, you will be able to return to your normal activities within a day or two.

You will see results as early as six weeks from your procedure. As your body continues to rid itself of the destroyed fat cells, you will continue to notice improvement; with optimal results typically seen at 12 weeks.

Get the lasting results you desire with either of these procedures.
