

## VI Peel Aftercare

The skin will look slightly tan, yellow or red immediately after the peel. On days one and two the skin will feel slightly tighter, with no Visible signs of having had a peel. Any pigmented areas might appear slightly darker. On approximately day three, patients will begin to peel. The first signs of peeling usually begin around the mouth area and continue for a day or two. With the use of the Vi Derm™ moisturizer, patients may go about their usual daily routine. By day six or day seven the patient will be done peeling and the results are dramatic! If a more aggressive peel was performed, a secondary peel might occur around day seven.
