

Revealing the Hidden Damage

Call us Today!
718-339-7982

The Florida Probe is a computerized probe that measures the gums around your teeth to determine the extent, if any, of gum disease. It is important that we probe and measure the areas between your teeth and gums during each of your office visits. It measures to the tenth of a millimeter and keeps a history to monitor disease progression. Early detection allows us to treat your gum disease before permanent, irreversible damage is done.

The Florida Probe System offers many advantages to you as a patient, including:

1 Improved accuracy: The systems probe ensures pocket depth measurements are far more accurate than those done by hand. With 0.2mm precision, we can more accurately determine the correct diagnosis and any necessary follow-up.

2 Automatic charting: the Florida Probe automatically generates your chair side probing report so you can more easily see these effects of periodontal disease. Now, we can go through your results with you in a more easy to visualize way.

3 Complete care: The Florida Probe can be used as a guide to measuring bone loss and gum recession. This allows us better understanding of your unique health needs and helps to develop a more tailored treatment plan for each patient.
