

## ABOUT OUR CLINIC

At our clinic, improving your health is always our primary concern. We approach each patient as an individual and realize that, although many patients experience similar complaints, the origin for these symptoms often varies significantly from person to person. Evaluation and treatment are focused on identifying and correcting the underlying cause of your problem, as well as providing symptomatic relief.

The emphasis of our care focuses on the treatment of the musculo-skeletal system and enhancing the nervous system to enable the body to better heal itself. Each day our physicians treat a variety of common health complaints, including; headaches, neck pain, lower back pain, disc bulge/ herniation, shoulder pain, pain/numbness down the arms, pain between the shoulder blades, whiplash injuries, buttock/hip pain, pain/numbness down the legs, muscle spasms, sprains/strains, tendonitis, chronic pain, TMJ, fibromyalgia, chronic illness and carpal tunnel syndrome as well as many others.

Although we treat many people with recent injuries (like motor vehicle accidents), most of our patients are trying to solve symptoms that show up "out of the blue." We find that most times these are from old and even minor injuries that were never addressed to begin with.

At this clinic, thoroughness is a top priority. We believe in evaluating you as a whole person and do not limit our examination to the area of pain and dysfunction. Often, the symptoms you experience in one region of your body are the result of your body compensating for improper functioning in another region. This approach allows for greater insight and a more complete understanding as to the full nature of your condition.

Our physicians and staff believe that educating our patients is just as important as improving their health. Helping you understand your health condition, how it progressed to its current state, and how appropriate treatment will help correct it, is an integral part of the healing process and should not be overlooked. To do this, we may use anatomical models, computer imaging, and instructional classes designed to help you "see" your current health condition. Research strongly supports this approach and has shown that patients who understand the full nature of their condition heal more quickly, with fewer relapses, than those who do not.

Our main objective is to find out why your body is not healing an area, get it to do so and ultimately have you **REGAIN YOUR LIFE!**
