"I had a lot of chores growing up: mowing the grass, raking the lawn, sweeping out the garage. I would sneeze all the time. As an adult, my allergies have knocked me out of commission for days. So I started taking the allergy drops and now I feel fantastic— 100% better!"

Ray S., Allergy Sufferer

If you want to leave *your* allergies in the dust, ask your healthcare provider today about an allergy program featuring immunotherapy.

Instead of just a short-term fix for your allergy symptoms, wouldn't you rather eliminate the cause of your allergies?

Allergies occur when your body perceives dust, molds, pet hair or pollens as threats, and rallies its defenses against them. Your body's reactions include sneezing, runny nose, watery eyes, skin rashes, sinus problems, wheezing, asthma and *much* more.

Prescription and over-the-counter allergy medications try to stop these symptoms so you feel temporarily better. They do nothing to relieve the cause of your allergies, which is why your misery returns season after season.

There is a long-term allergy solution!

Immunotherapy desensitizes your body to these normally harmless environmental particles called antigens. Very small doses are introduced to your system via serum. As treatment progresses, the concentration of antigens in the serum increases so your immune system learns to ignore them, making you a much happier person during allergy season!

There are two types of immunotherapy: shots and sublingual (under the tongue) drops. Both are effective. Shots have been used in the U.S. for decades. They require you to visit an allergy specialist's office up to twice a week for 3-5 years of injections. Each visit usually requires you to miss work or school, spend money on co-payments and gas and adjust your busy schedule. Fortunately, there is a better, easier, more convenient way to receive immunotherapy...

Easy and painless is the way to go!

Sublingual immunotherapy has been popular throughout the world for over 60 years. In the comfort of your home, you simply place a few drops of serum (the same serum used in allergy shots) under your tongue every day. You only need to visit your healthcare provider every 12 weeks for a refill and a quick follow-up. By your first follow-up, you'll likely notice a marked improvement. Within a few months, you should realize a significant reduction in the need for allergy medications. And, in four years, if you're like most patients, your environmental allergies will go into remission!

Why Choose Allergy Drops?

- They are natural and extremely safe with rare, mild side effects
- Most patients feel noticeable relief within just two months of starting treatment and many improve in as little as a few weeks
- They are painless—no shots or scary needles
- You avoid excess trips to the doctor's office, saving lots of time and money
- They work especially well for children
- They provide long-lasting results

Your path to freedom from allergies starts with a simple, quick test.

If you've had, or heard about, allergy tests in the past, you know they included a painful series of shots in the back or arms, then a long wait as your skin turned red, itchy and uncomfortable. No longer. Now, after your healthcare provider reviews your medical history and checks your lungs, you'll receive a pain-free skin test* that will reveal your allergies in just 15 minutes. You'll also find out if immunotherapy is the right solution for you. If so, you can immediately begin to put your allergies behind you!

*People with certain medical conditions may be required to take a blood test instead.

"My son Dylan has had bad allergies and asthma for six years; he's allergic to trees, grass, cats, dogs and more. The allergies really affected his quality of life; he couldn't participate in the sports he loves. He had to take medications regularly and was often intolerant of them. We got him on the allergy drops and within a week I could see the difference! Now he's got his life back!"
