

Facial Regeneration (PRP) with MicroNeedling:

The MicroPen™ Rejuvenation treatment combined with the Platelet Rich Plasma (PRP) therapy is the latest cutting edge therapy in the field of natural cosmetic enhancements.

This non-surgical, natural treatment is used to help patients with all skin types and is a corrective and preventative therapy to:

- Treat fine lines and wrinkles
- Manage scars from acne or other injuries
- Improve skin texture and discoloration from melasma
- Reduce stretch mark appearance
- Stimulate new collagen growth and tighten the skin
- Enhance skin on the face, neck, décolletage, back, abdomen, arms, hands and legs.

It is important to distinguish the difference between injecting PRP under the skin and administering PRP via a micro-needling technique. When PRP is injected under the skin, the skin is stimulated through improved circulation, improved fat cell quality, and improved collagen volume and blood supply. Patients notice an immediate “glow” to their skin, and visible changes continue to develop over the course of several days and weeks. Specifically, patients see the greatest results in 60-90 days after treatment and results continue to improve for up to 6 months as collagen production continues!
