

Dr. Andrew Carver, D.P.M.

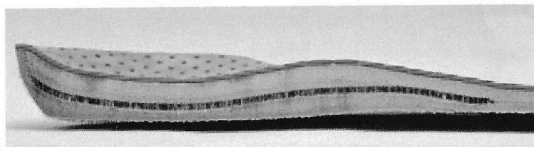

Soft Orthotics Yield Pain Relief

Hard orthotics promise relief for sufferers of planter fasciitis and Achilles tendonitis. Yet wearers complain that walking remains painful because hard orthotics offer no cushioning from unforgiving hard floors and concrete sidewalks. Soft or rubberized orthotics, in contrast, give superior pain relief. They reduce stress on feet and body because they absorb the shock of walking on hard surfaces.

Pro Support Systems are the best orthotic available. They are considered the "Rolls Royce" of orthotics by many podiatrists.

This orthotic has a thin polypropylene arch sandwiched between two layers of shock absorbing rubber. It offers just the right amount of support and cushioning.

Pro Support System orthotics never wear out or lose support by flattening out. Wearers feel the difference immediately when they switch to Pro Support Systems orthotics.
