

## A Guide to Prenatal Genetic Testing

---

**There is a lot you can do during your pregnancy to help you have a healthy baby. Taking prenatal vitamins, eating healthy foods, and getting some exercise and enough sleep will help you have a health pregnancy.**

The human body is complicated. Even if you do everything “right” during your pregnancy, things don’t always develop normally. Between 3% and 5% of babies have some type of health problem when they are born.

You can be tested during your pregnancy to lean more about your baby’s health before baby is born. Your health care provider will talk about these tests with you and ask you to decide which tests you want. It is your choice whether or not to be tested.

### What are the tests?

There are two basic types of tests:

- **Screening tests** predict the chance, or odds, that your baby has a certain birth defect.
- **Diagnostic tests** tell you whether or not your baby has a certain birth defect.

*The table below and on the next page lists the different tests, along with a timeline an brief description about each one. Let us know if you would like more information to read about them before you talk with your doctor.*

SCREENING TESTS			
Name of Test	When	Description	What it tells you
<b>Nuchal translucency (NT) ultrasound</b>	11 to 13 weeks	Abdominal ultrasound to measure small space behind baby’s neck.	Chances your baby has a chromosome problem.
<b>Integrated screen</b>	11 to 13 weeks and 15 to 22 weeks	NT ultrasound plus 2 separate blood samples.	Chances your baby has Down syndrome, trisomy 18, or spina bifida.
<b>Quad Screen</b>	15 to 22 weeks	1 blood sample	Chances your baby has Down syndrome, trisomy 18, or spina bifida.
